

The Vagus Nerve is also called the 10th Cranial Nerve.

Sympathetic Nervous System

BROAD DESCRIPTIONS OF VAGUS NERVE

The vagus nerve is called the largest nerve in the body. It emanates from the Pyramid of the brain nerve structure in a paired presentation. It is call vagus (even when there are two branches) after the word vagabond because it “wanders” down the body and branches out to most organs. It is nicknamed:

- (1) The immune system’s conduit to the brain (because it shuts the body down for rest/sleep when there is an infection).
- (2) The Pneumogastric nerve because it so strongly affects the health of the intestines and the lungs.
- (3) A branch of the Sympathetic nervous system (The root cells of the vagus are the same as the root cells of the sympathetic nervous system).

The Vagus Nerve Controls:

- (1) Heart Rate
- (2) Gastrointestinal Peristalsis
- (3) Sweating
- (4) Muscle Movement in Mouth
 - a. Speech
 - b. Keeping Larynx open for breathing
 - c. Voice boxes are strained
- (5) The inner canal of the outer ear

The more the vagus nerve is stifled, the more the many dependent organs labor to function correctly. For these people life is more of a struggle than for others. Digestive aids are used more commonly used. Heart attacks are more common. Livers are delicate. Blood sugar issues are more pronounced. They catch things in their lungs more easily.

SUMMARY OF REMEDIES
 (with range of bottles needed) **498**

Dinoflagellate Encephalitis	6
Vagus Node Regen Group	6
Glioma Complex	6
One or two meningitis infections	
Cranial Nerve Completion	6

See picture of Vagus nerve influence.

The solution turned out to be all the herpes viruses (childhood diseases) were lodged in the root of the vagus nerve. We use **Dinoflagellate Encephalitis** to antidote the base weakness. The weakness causes gliomas so we use **Glioma Complex**. For some the whole plexus of cranial nerves never fully “cooked” at birth, so we use **Cranial Nerve Completion**.

With such an impaired start, we found that the vagus nerve nodes (roots) began to degenerate early so we used **Vagus Node Regeneration Group**.

With these weaknesses we found the subjects’ systems were more prone to meningitis infections – usually one or two per subject. See list of meningitis infections under Meningitis section.

The ensemble or remedies have revived vagus nerve function usually slowly but surely.

Current science divides vagus nerve disorders into 2 categories – overactive and underactive !

Overactive vagus nerves can cause frequent fainting.

An underactive vagus nerve can lead to a condition called gastroparesis. This condition leads to:

- (1) nausea
- (2) heartburn
- (3) stomach pains
- (4) spasms in the stomach
- (5) weight loss due to the digestive system having too little of the chemicals it needs to break down food.
- (6) dropping heart rate. Pacemakers specifically for the vagus nerve are a common medical answer to dropping heart rate.

In addition to the organ damage or difficulties that accompany a damaged vagus nerve there are other side effects that may be a sign that your vagus nerve is not working properly. You may be more susceptible to developing peptic ulcers because the body is producing more stomach acid than it should. You may also begin to develop constipation because your intestines are not regulating water intake the way they should.

The common profile of a Vagus Nerve pathology is:

- (1) Digestive problems from an early age
- (2) Frequent nausea
- (3) Multiple intolerances to food
- (4) Problems with breathing that are heightened with stress
- (5) Heart palpitations, usually with stress
- (6) Anxiety and adrenal overload
- (7) Depression

The current medical approach reflects the current state of knowledge (or lack of) about vagus nerve dysfunction. In using this approach, the subject may encounter disbelief that anything can work.

HISTORY

The vagus nerve has been under study for many years before 2015. The solution was found by work with a 59 year – old female who has needed a 4 hour colonic daily for the previous 8 years. To regain colon function, she had previously studied and experienced the programs of (1) the Wigmore Institute with its wheat grass-led dietary approach, (2) Huda Clark’s approach, including the removal of 4 teeth and a stringent detoxification program. (3) 3 other diet-based national programs with good track records. She became a colon therapist. She became vegetarian, close to vegan. She took a panoply of vitamins, nutrient pills and enzymes. She became an expert in juicing programs and worked successfully at a juice bar.

When we started, she would have backaches and not be able to stand if she did not have a colonic daily. “Nothing moved” without a colonic. Abdominal spasms were common as a sign of need for a colonic. She was losing hair from the colloidal silver that had been injected in every previous colonic. She needed a remedy to antidote the colloidal silver to stop the hair loss. The solution did not happen overnight.

As she took the remedies listed plus 2 remedies for meningitis, the colonics became more fruitful. She cleansed more deeply than ever before. Near the end of the remedies, the time frame for colonics reduced from 4 hours per colonic to 1 hour. Her hair loss stopped. Her system began to tolerate salmon. . Several opportunistic colon infections popped up during the program and were antidoted.

When she finished the remedies, she gradually needed a colonic every third day instead of every day. Each time she skipped the colonic she could feel food moving by itself in the small intestines. Gradually the small intestine regained its strength and peristaltic ability. Part of the problem was the necessary dependence on the colonics had weakened the small intestines through non use. She reduced supplements by 90%. There were patterns of fear to overcome from skipping a day without a colonic.

A very unhappy childhood began to reveal its affect on gripping the colon. It measures as 20% of the original problem. The next step is to release the cause of the grip.

A SECOND HISTORY comes from a 45 year old female who constantly used colonics and enzymes to evacuate. Her story is much more succinct. A letter came saying, “Thanks for the remedies. I’m pooping regularly without help. By the way, my frequent cough disappeared”.
